EFFECT OF ATHLETIC TAPEING AND KINESIO TAPEING® ON FUNCTIONAL PERFORMANCE IN CHRONIC SPRAINED ANKLE

Seda Bicici, Nihan Karata, Gül Baltaci
Hacettepe University, Faculty of Health Sciences, Department of Physiotherapy and Rehabilitation 06100 Ankara-Turkey

Many athletes from different sports think that taping and bracing is important in acute or chronic phases of an ankle injury. Certainly, many athletes know that ankle support is important for their performance (10). In basketball ankle injuries are very common and they are among the most severe (18-28). An Australian basketball study (19) showed that ankle injury rate over half (53.7%) of total time missed in basketball.

Goal of the study:
The purpose of this study was to investigate the effects of Kinesio Taping® and Athletic Taping of chronic sprained ankle on functional performance to determine the most effective taping method.

Materials and methods:
15 male basketball players between the ages of 18 and 22 (mean age: 20.33 ± 1.4 yrs) participated in the study.

The inclusion criterion was having recurrent ankle inversion sprain (at least three sprains) while the exclusion criteria were 1) history of ankle fracture, 2) ankle injury within three months of participation, 3) history of anterior cruciate ligament injury, 4) current participation in supervised physical rehabilitation, 5) having functional ankle instability, 6) any neurological deficit. Subjects were screened using a questionnaire which asked for details on demographic variables, equipment used and medical history.

Cumberland Ankle Instability Tool (CAIT). The maximum CAIT score is 50; a score ≥24 indicates functional instability.

Performance tests mentioned below were applied to all subjects with placebo taping, without any taping, athletic taping and kinesio Taping® at one week intervals.

Proprioception assessment: SportKat (Kinesthetic Ability Trainer)
Coordination and balance tests: Hopping Test, Star Excursion Balance Test
Agility: Vertical Jump Test, Single Limb Hurdle Test
Endurance: Standing Heel Rise Test

Results and conclusion:
There was no significant difference between the performance of the athletes with placebo taping and those without taping in any tests. No significant difference was observed among all the trials in SEBT (anteriore p=0.121; anteromedial p=0.126; medial p=0.326; posterior p=0.075; posterolateral p=0.053; lateral p=0.25; anterolateral p=0.957) and KAT Dynamic tests (p=0.241). Kinesio Taping® and athletic taping led to similar results in functional performance tests, except standing heal rise test and vertical jump test. In these two tests, athletic taping had a negative effect. Kinesio Taping® did not cause any negative effects in any of the tests.
